

ORIFLAME SOFTWARE s.r.o. – Mobile development for Oriflame

Unicorn Systems provides development services for Oriflame Software for mobile application development. This is an extension of cooperation beyond the activities of analysis, development, and testing, which began in 2015.

Success story

The new Oriflame App is intended to be the main tool for communication between Oriflame consultants and customers via mobile devices worldwide.

The application offers a view of the product portfolio, special product offers, shopping cart, professional advice on beautification techniques and more. For registered Oriflame consultants, the application offers the possibility of monitoring their business activities.

Oriflame Software has decided to replace its existing mobile application with a new generation of solutions. The new native application is built on the latest technologies and will be gradually deployed in selected markets around the world.

Unicorn Systems has been providing its services to Oriflame since 2015, which has made it a logical choice to become a partner in the development of this application. Unicorn's mobile development specialists are mainly working on the iOS version of the application.

All implementation teams in Oriflame Software develop products and solutions in accordance with the **SCRUM** methodology, and the MV7 team, in which a new mobile application is created, follows this methodology as well.

Used technologies: Swift, Kotlin Multiplatform, Firebase Analytics, Adyen Analytics, Microsoft Azure, Microsoft DevOps

Statement of the representative ORIFLAME SOFTWARE s.r.o.

"Unicorn has confirmed its reputation as a flexible and customer-oriented provider of ICT services.

Together, we were able to accelerate the development of a new mobile application, which is one of the important business channels.

Unicorn Systems met my expectations and I am very satisfied with their work."
